TEXT:

You cant help loving Apple's new browser, Safari, if you're a Mac OS X user. It's still in beta and not as fully-featured as other Mac browsers, but its KHTML engine really is fast. It's much faster than Internet Explorer 5 for the Mac, which it leaves in the dust for page rendering speed and JavaScript handling.

It's not until you start browsing with Safari that you begin to realise what a lumbering behemoth the Mac version of IE5 is. Not only does Safari render pages faster (three times faster, if you believe Apple) but it feels slicker, quicker and friendlier than the competition.

There isn't any unnecessary clutter on the screen to interfere with the Web pages it displays -- none of those nasty big 'back', 'forward', 'print', 'mail' and 'home' icons to steal screen real-estate. You get just what you need -- a compact set of six buttons to the left of the URL bar, and a Google search field to the right of it. A 'snapback' button next to the Google search lets you return to the last URL you typed in or the top level of a website you've been drilling down through. Add a bug report button to the right of that and Safari's brushed-steel interface is complete.

The browser has a few problems handling DHTML menus and Cascading Style Sheets, and didn't load a Java applet to allow secure online banking -- that's a problem shared by other OS X browsers.

In its favour, Safari has an effective popup blocker, intuitive iTunes-like bookmarks menu, and a downloads manager that cleans up after itself so you don't get old .sit files lying around on your desktop. Some Apple fans are complaining about the lack of tabbed browsing, but they can always command-shift-click and open new windows in the background.

FORMATS

Mac OS X

KEY FEATURES

- (X) Tabbed browsing
- (X) Customisable skins
- (Y) Cookie management
- (Y) Pop-up killer
- (X) Accepts non-standard code

THE LOWDOWN

BRIEFLY Promising looking OS X browser from Apple, still in development

PROS Good performance, uncluttered interface, iTunes-like bookmarks, 'snapback' feature

CONS No tabbed browsing, still in beta -- some bugs

SCORE

WHAT OUR RATINGS MEAN

**** - EXCEPTIONAL

**** - IMPRESSIVE

*** - GOOD

** - OK

* - DISAPPOINTING

Ease Up on Web Searching. (Ease Up on Web Searching - Google Toolbar lets
you perform searches on the fly and go back to previous queries.)

click to see larger image) The Google search box sits at the top of your browser. Google is my favorite search engine. There, I've said it. I know I'm not alone, but I wanted to get that out of the way. When I saw a browser add-on that's designed to let me search using Google from wherever I am on the Web or search only the site that I'm visiting, I jumped at the chance to download it. I wasn't disappointed. The program, which installs and integrates with Microsoft's Internet Explorer 5.0, is simple to install and gets you up to speed immediately. Before you download the program Google makes it very clear that depending on the configuration you choose, you may be sending back personal information in the form of a "paper-trail" of the Web sites you visit. This data helps Google create a feature it calls Page Rank which, according to Google, is designed to measure a site's quality. The more people and links that connect back to it, the more credible it's supposed to be. I don't think this holds true, because in my experience many of the porn sites have high page ranks, too. If you're not keen on providing your surfing data, you can choose a version without advanced features. I took the plunge and installed the former version. (click to see larger image) A Highlighter option lets you find your search terms quicklyOnce installed, the toolbar sits inconspicuously at the top of your browser. Unless in use, the only thing you'll see is a search box and the Google logo -- everything else is grayed out. You can enter search terms into the box and press Enter on your keyboard to start a search. Your results are returned just as they would be if you had started on the Google home page. This was a little annoying because it meant that I lost the current page I was looking at. I really liked what the toolbar features could do, though. Once you click on a result, you can search just that site or turn on the Google highlighter that highlights all of your search terms. You can also access the site's page info that includes a cached snapshot of the page. It also lets you go directly to a list of similar sites, and most interestingly, look at a list of other sites that provide links to the page you are visiting. At any time, you can also click on the Up button , which takes you to the site 's top level. Google Toolbar was every bit as good as I hoped it would be. However, the invasive site reporting, the fact that it takes you away from the page you start out on, and its lack of Netscape support are limitations. Hopefully, future versions will address these issues. In the meantime, I'm keeping it anyway.
